

MediScan AI Medical Report

Report generated: 2026-05-27 10:42 UTC

Patient: mustansir

Username: mustansir

Patient Summary

Age: 18 | Gender: Male | BMI: 22.2

Chronic diseases: diabetes

Previous surgeries: none

Allergies: dust, pollen , milk

Current medications: poiz 30, cyblex m80

Presenting Complaint

Symptoms: Fever, headache, and body aches. High temperature around 101 degrees Fahrenheit.

Duration: 3 days

Severity: Moderate

Diagnostic Findings

Diagnostic Report

Patient Profile:

- **Name:** Mustansir
- **Age:** 18
- **Gender:** Male
- **Weight:** 50.0 kg
- **Height:** 150.0 cm
- **Chronic Diseases:** Diabetes
- **Surgeries:** None
- **Allergies:** Dust, pollen, milk
- **Current Medications:** Poiz 30, Cyblex M80
- **Smoking:** No
- **Alcohol:** No
- **Exercise Frequency:** Less
- **Sleep Hours per Night:** 8.0

Symptoms:

- **Fever:** 101°F
- **Headache
- **Body Aches
- **Duration:** 3 days
- **Severity:** Moderate

Preliminary Diagnosis List:

1. **Viral Infection (e.g., Influenza)**
 - **Likelihood:** High
 - **Explanation:** The combination of fever, headache, and body aches is characteristic of viral infections, particularly influenza, which is common in younger populations and often presents with these symptoms.
2. **Bacterial Infection (e.g., Streptococcal Pharyngitis)**
 - **Likelihood:** Moderate
 - **Explanation:** A bacterial infection such as streptococcal pharyngitis can present with fever and headache, and may also cause body aches. This condition often requires antibiotic treatment.

3. **Dengue Fever**

- **Likelihood:** Low to Moderate

- **Explanation:** Depending on the geographical location and recent travel history, dengue fever could present with fever, body aches, and headache. However, additional symptoms such as rash or bleeding would support this diagnosis.

Medication Recommendations:

- **Acetaminophen (Tylenol)**

- **Dosage:** 500 mg every 6 hours as needed for fever and headache.

- **Maximum Daily Dose:** Do not exceed 3000 mg in 24 hours.

- **Stay Hydrated:** Encourage increased fluid intake to prevent dehydration, especially if fever persists.

Safe Home Remedies:

1. **Rest:** Ensure adequate rest to support the immune system.

2. **Warm Compress:** Applying a warm compress to the forehead may help alleviate headache symptoms.

3. **Hydration:** Drinking warm herbal teas (e.g., ginger or chamomile) can soothe symptoms and keep the body hydrated.

Red Flags for Immediate Medical Attention:

- Persistent high fever (above 103°F)

- Severe headache that worsens or does not improve with medication

- Difficulty breathing or chest pain

- Signs of a rash or bleeding

- Symptoms that worsen or do not improve after 3 days

Urgency Level:

- **Moderate Urgency:** While the symptoms are concerning, they do not indicate an immediate life-threatening condition. However, follow-up is necessary if symptoms persist or worsen.

Professional Next-Step Recommendations:

1. **Follow-Up Appointment:** Schedule a follow-up consultation in 3 days to reassess symptoms and consider laboratory testing if symptoms persist.

2. **Monitor Symptoms:** Advise the patient to keep track of fever patterns, headache severity, and any new symptoms that may arise.

3. **Consider Testing:** If fever persists beyond 3 days or if symptoms worsen, consider testing for viral/bacterial infections, including a rapid strep test or complete blood count (CBC) to rule out other conditions.
